

Problem Statement

With the rapid growth of mobile applications on the Google Play Store, businesses and developers face intense competition to attract users and achieve higher app installs. Despite having access to large amounts of app data such as ratings, reviews, pricing, and categories, companies often struggle to understand which factors truly influence app success and user engagement.

The business needs to analyze Play Store app data to identify the key drivers behind app installs, user ratings, and customer satisfaction. By understanding patterns across different app categories, pricing models, and user feedback, the company aims to uncover actionable insights that can help improve app performance, optimize pricing strategies, and enhance user experience to increase installs and overall market competitiveness.
